

# BETA THALASSEMIA MULTIPLEX REAL TIME PCR KIT (12 MUTATIONS)

Cat. No: 16R-20-12

#### **PRODUCT DESCRIPTION**

Beta Thalassemia is a group of inherited autosomal recessive blood disorders that originated in the Mediterranean region. In thalassemia the genetic defect, which could be either mutation or deletion, results in reduced rate of synthesis or no synthesis of one of the globin chains that make up hemoglobin. This can cause the formation of abnormal hemoglobin molecules, thus causing anemia, the characteristic presenting symptom of the thalassemias. Beta Thalassemia Real Time PCR Kit includes, IVS1.1 (G>A), IVS2.1 (G>A), IVS1.110 (G>A), IVS2.745 (C>G), IVS1.5 (G>C), IVS1.6 (T>C), -30(T>A), Cd 5 (-CT), Cd 29 (C>T), Cd 39 (C>T), Cd 44 (-C) and HBS mutations.

#### PRINCIPLE OF THE SYSTEM

During the PCR reaction, the DNA polymerase cleaves the probe at the 5' end and separates the reporter dye from the quencer dye only when the probe hybridizes perfectly to the target DNA. This cleavage results in the fluorescent signal which is monitored by Real-Time PCR detection system. An increase in the fluorescent signal (CT) is proportional to the amount of the specific PCR product.

#### **PRODUCT SPECIFICATION**

Each isolated DNA should be tested with 12 mixes. The kit provides reagents in a ready-to-use mastermix format which has been specifically adapted for 5' nuclease PCR using patented SNP analyses. The test system is designed for use with sequence specific primers and probe.

The fluorescence of mutation analysis is FAM, HEX/JOE. Also each mastermix contains an internal control labelled with CY5 dye.

#### **SYSTEM CONTENTS**

		=
	Reagents	20 Rxns
•	BT-Mix 1	400 µl
•	BT-Mix 2	400 µl
•	BT-Mix 3	400 µl
•	BT-Mix 4	400 µl
•	BT-Mix 5	400 µl
•	BT-Mix 6	400 µl
•	BT-Mix 7	400 µl
•	BT-Mix 8	400 µl
•	BT-Mix 9	400 µl
•	BT-Mix 10	400 µl
•	BT-Mix 11	400 µl
•	BT-Mix 12	400 µl
•	Control DNA*	75 µl

### STORAGE

- All reagents should be stored at 20 °C and dark.
- All reagents can be used until the expiration date on the box label.
- Repeated thawing and freezing ( >3X) should be avoided, as this may reduce the sensitivity of the assay.

#### **DNA EXTRACTION**

Blood samples should be collected in appropriate sterile EDTA tubes and can be stored at +4°C up to one month. For more than one month specimen should be stored at -20°C. It is advised to gently mix the tube (with EDTA) after collection of blood to avoid coagulation.

Our system optimized according to MN NucleoSpin  $^{\otimes}$  Blood. It is advised to elute DNA with **150 \mul elution buffer** for better results.

#### **PROCEDURE**

- Different tubes should be prepared for each mix.
- Before starting work, mix the mastermixes gently by pipetting
- For each sample, pipet 20 μl mastermix\* with micropipets of sterile filter tips to each optical white strips or tubes.
- Add 5 μl (~10-100 ng) DNA into each tube.
- Run with the programme shown below.

#### **PCR PROGRAMME**

Table 2: PCR programme

95 ℃	3 Min.	Holding					
95 °C	15 Sec.	30 Cyalas					
60 °C	1 Min.	30 Cycles					

Fluorescent dyes are FAM, HEX/JOE and CY5.

# This system can use with;

ABI 7500/7500 Fast

Bio-Rad CFX96

## If you use;

 ABI Prism<sup>®</sup> system, please choose "none" as passive reference and quencher.

#### **DATA ANALYSIS**

After the run is completed data are analysed using the software with FAM, HEX (JOE) and CY5 dyes. The below results were studied with BioRad CFX96.

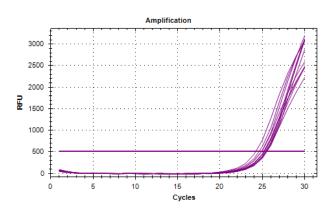

Figure 1: Internal control – CY5 Dye

Internal control amplification plots must be seen in all wells except NTC and has been labelled with CY5 dye. The CT value of internal controls should be  $22 \le X \le 26$ .

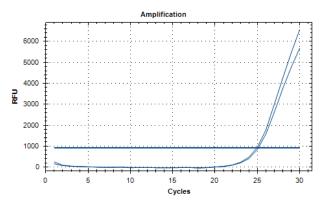

Figure 2: IVS2.1 G>A Heterozygote (Mix 9 & 10) – FAM Dye

Amplification plots of mutations can be analysed by related dye\*. The CT value should be between  $21 \le CT \le 26$ . These values are optimised according to the SNPure® Blood DNA Isolation Kit and MN NucleoSpin® Blood DNA Isolation Kit. CT values may vary  $\pm 2/3$  cycle according to the DNA isolation protocol.

- Homozygote wild-type sample gives amplification signal only with wild-type mastermix.
- Heterozygote sample gives amplification signal both with wild-type and mutant mastermixes.
- Homozygote mutant sample gives amplification signal only with mutant mastermix.
- The diffrence of the CT value wild-type and mutant amplification plots should be ≤3 for heterozygote mutant sample. It is 4 ≤ CT ≤6, test should be repeated.

<sup>\*</sup>Master mixes include HotStart Taq DNA Polymerase.

<sup>\*</sup>Please check tubes / mutations / dyes table (table 1).

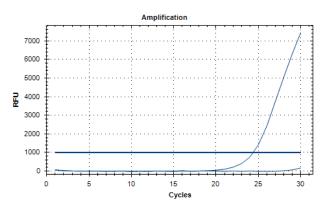

Figure 3: IVS2.745 C>G Wild Type (Mix 11 & 12) – FAM Dye

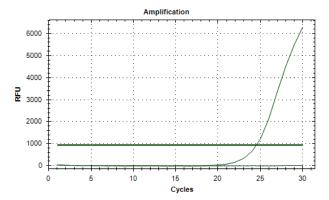

Figure 4: IVS1.110 G>A Wild Type (Mix 3 & 4) – HEX Dye

# TROUBLE SHOOTING

# If internal control doesn't work,

- Absence of DNA
- Sample is containing DNA inhibitor(s)

# If plots start late,

Compare positive control and sample. If there is no problem in positive control,

- DNA quality is not good.
- The amount of DNA is not enough.

Please contact us for your questions.  $\underline{\mathsf{tech@snp.com.tr}}$ 

# **CAUTIONS**

- All reagents should be stored at suitable conditions.
- Do not use the PCR mastermixes forgotten at room temperature.
- Thaw PCR mastermix at room temperature and slowly mix by inverting before use.
- Shelf-life of PCR mastermix is 12 months. Please check the manufacturing data before use.
- Only use in vitro diagnostics.
